BSIG table

+ tax

This sturdy table has been assembled using railing components made in the 1920s – a series of steel tubes held together with cast iron connecting elements made by the German firm Bergische Stahlindustrie (hence the BSIG marking) in Remscheid. We turned them into a table substructure. Since the connectors are available in a wide range of types, almost any geometrical arrangement is possible. The tabletop is made of common beech and was taken from a workbench once used by the Deutsche Reichsbahn railway operator. The photo should be regarded as merely a sample as large quantities of the railing components, tabletops and hardwood boards are available for alternative designs.

Availability:

The table shown in the picture is sold. However, similar tables are available on request. Please contact us if you are interested.
